DATA HANDLING AND VISUALIZATION

SET 6: PRODUCT SALES ANALYSIS

Student Name	N. Harshith
Register Number	192325078
Department	AIML
Dataset	Monthly Product Sales
Date	08 October 2026

EXPERIMENT: PRODUCT SALES ANALYSIS

Dataset: Monthly Product Sales

Product ID	Product Name	January Sales	February Sales	March Sales
1	Product A	2000	2200	2400
2	Product B	1500	1800	1600
3	Product C	1200	1400	1100

Objectives

- Create a grouped bar chart to compare first-quarter sales for each product.
- Generate a stacked area chart to visualize the overall sales trend.
- Build a labelled table containing monthly sales for every product.
- Prepare a dashboard combining the charts and table for interactive exploration.
- Identify the highest-selling month and product from the dataset.

Program 1: Grouped Bar Chart

A grouped bar chart compares January, February and March sales of Products A, B and C side-by-side.

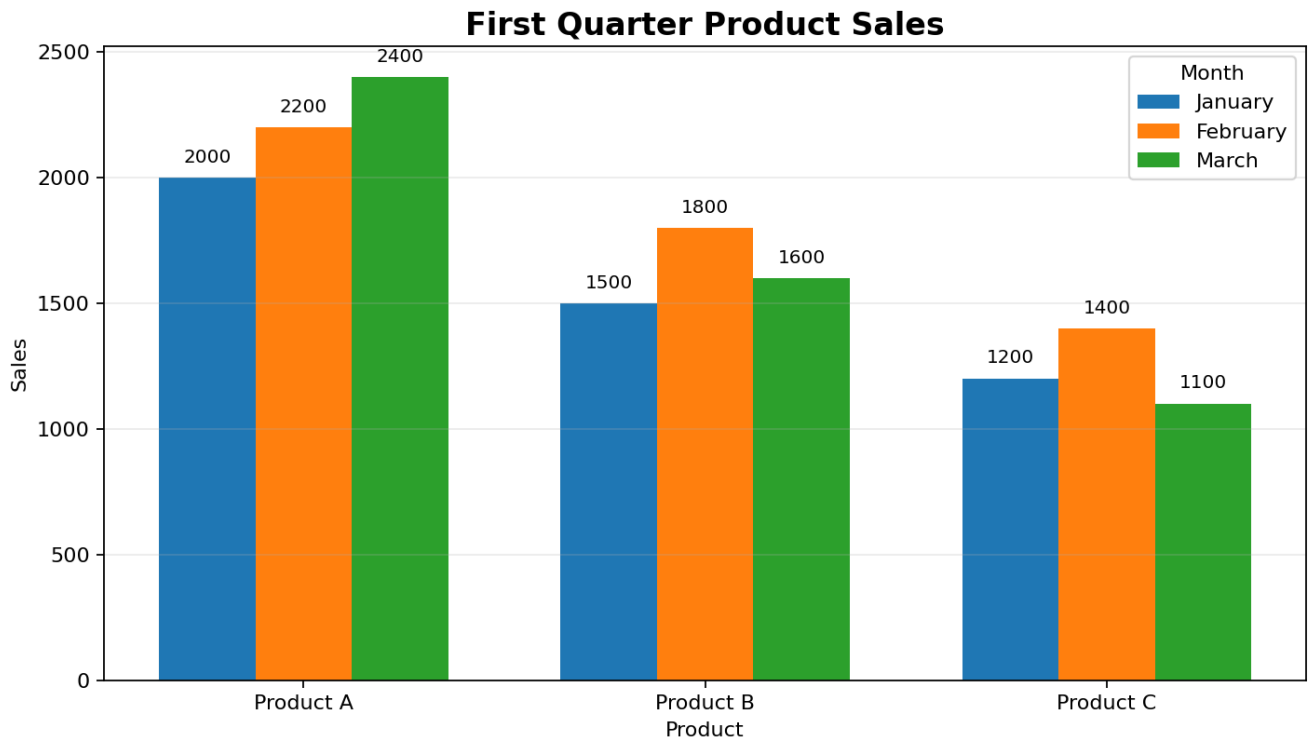

Figure 1: Grouped bar chart of first-quarter product sales.

Observation: Product A has the highest sales in all three months. Its sales rise from 2,000 in January to 2,400 in March.

Program 2: Stacked Area Chart

The stacked area chart shows how the three products contribute to total sales across January, February and March.

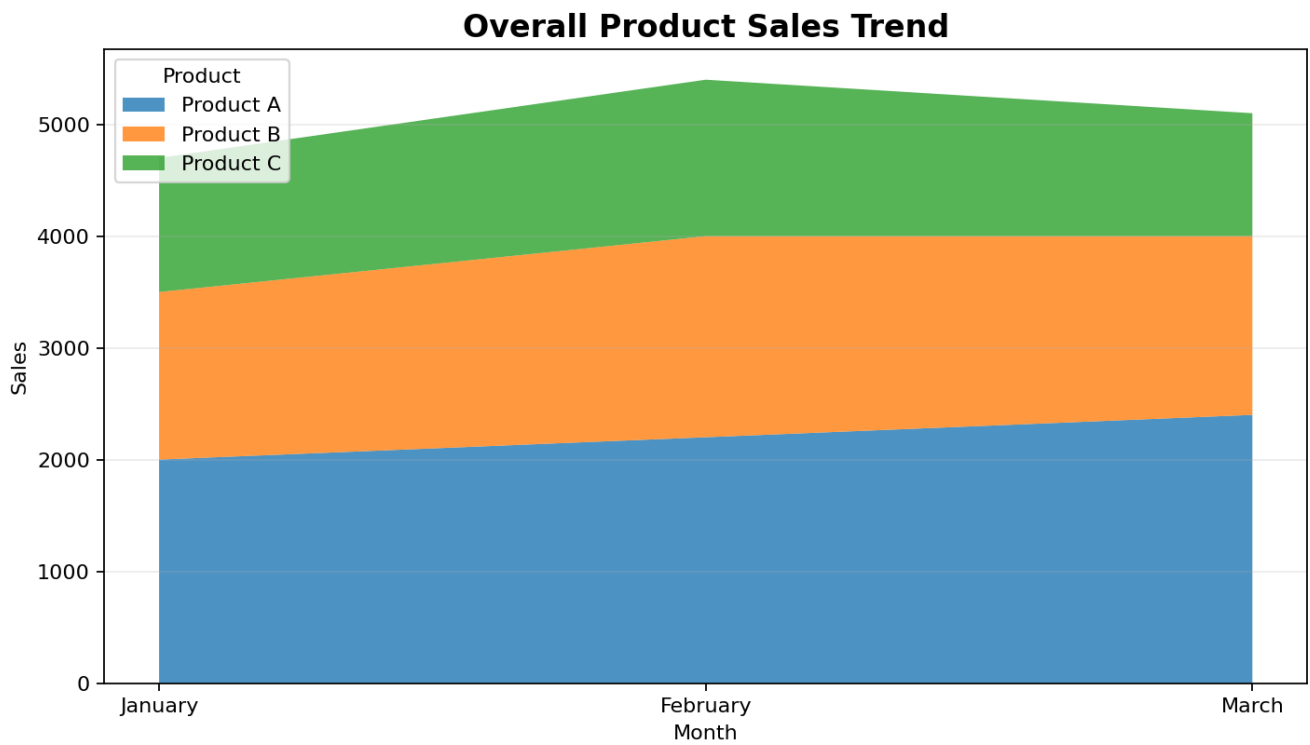

Figure 2: Stacked area chart showing the overall sales trend.

Observation: Total sales are 4,700 in January, 5,400 in February and 5,100 in March. February has the highest overall sales.

Program 3: Monthly Sales Table

The table presents the complete monthly sales values for each product with clearly labelled columns.

Monthly Product Sales Table

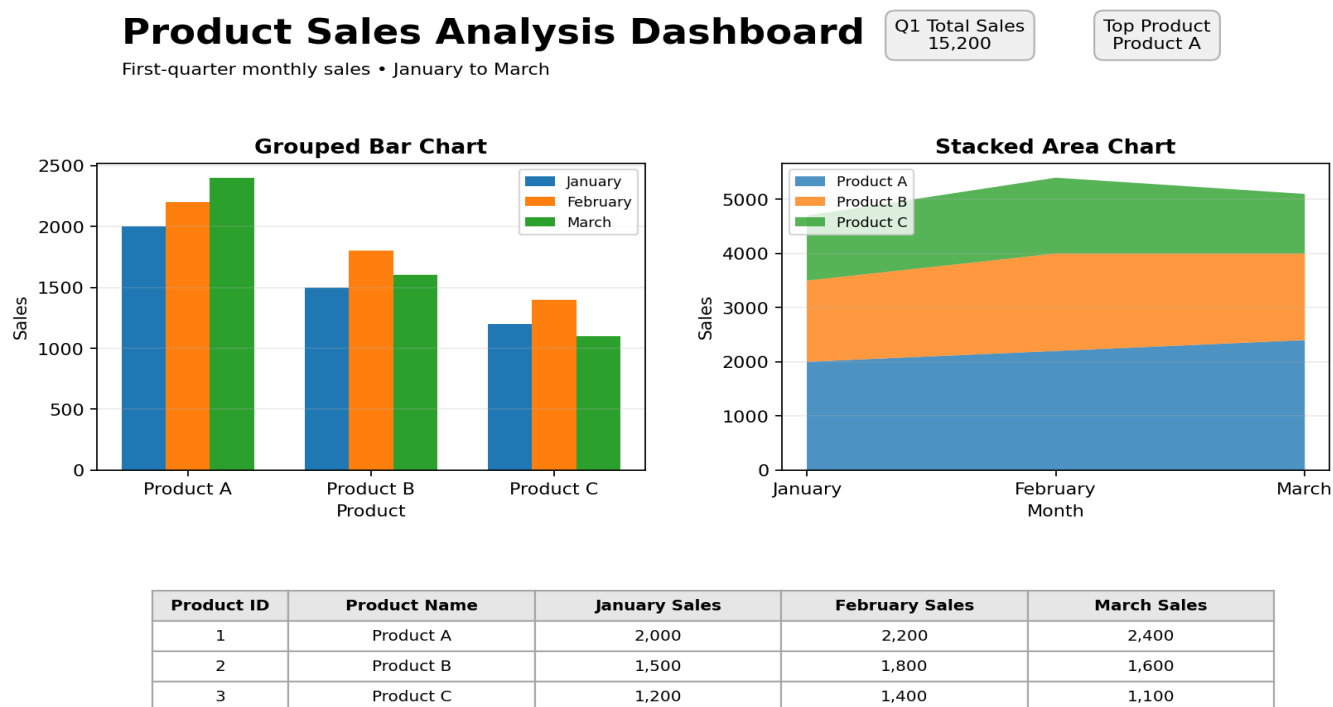

Product ID	Product Name	January Sales	February Sales	March Sales
1	Product A	2,000	2,200	2,400
2	Product B	1,500	1,800	1,600
3	Product C	1,200	1,400	1,100

Figure 3: Monthly product sales table.

Observation: The table provides a direct numerical comparison of all products across the three months.

Program 4: Tableau Dashboard

The dashboard combines the grouped bar chart, stacked area chart and monthly sales table. It is an illustrative Tableau-style dashboard created from the supplied dataset, not a screenshot captured from Tableau.

Illustrative Tableau-style Dashboard

Figure 4: Illustrative Tableau-style dashboard for product sales.

Dashboard interpretation: Q1 total sales are 15,200. Product A has the highest Q1 sales at 6,600, and February has the highest monthly total at 5,400.

Overall Result

The Product Sales Analysis experiment was completed successfully. The grouped bar chart compared monthly product sales, the stacked area chart visualized the overall sales trend, the table displayed the monthly sales data, and the dashboard combined all three views for analysis.

Key Findings

- January total sales: 4,700
- February total sales: 5,400
- March total sales: 5,100
- Highest-selling month: February
- Product A Q1 sales: 6,600
- Product B Q1 sales: 4,900
- Product C Q1 sales: 3,700
